

Practitioner Report: Number Challenge

Sample Report

26/05/2022

Introduction

This report provides an overview of the candidate's results after completing the Number Challenge test. The test measures the candidate's reasoning skills when dealing with novel numerical information.

The test score is based on both accuracy and speed. Although the test is not time-limited, the time taken to make a response is recorded and taken into account in the score. The score is then compared to a norm group to give a percentile. This can be used to compare candidates and make selection decisions. An overview of what the test measures, the candidate's result and what this indicates, is provided below.

Number Challenge

This test assesses how quickly and accurately the candidate can process novel numerical information and use this to calculate the answer to the question. This type of reasoning ability is involved in tasks that require analysis and interpretation of numerical data, such as working with graphs or budgets, or carrying out various calculations.

Taking into account the number of questions answered correctly, and the time taken for each correct answer, the candidate scored above average on the Number Challenge test. This suggests they are likely to accurately interpret numerical information more quickly and effectively than many other people.
