

# Practitioner Verbal Report

## Sample High

03/08/2021

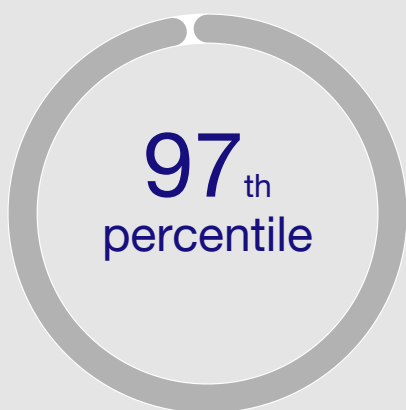

# Introduction

This report provides an overview of the candidate's results after completing the Sova reasoning test. The test measures the candidate's reasoning skills when dealing with different types of novel information (written and/or numerical).

Sova reasoning scores are based on both accuracy and speed. Although the tests are not time-limited, the time taken to make a response is recorded and taken into account in the score. The score is then compared to a norm group to give a percentile. This can be used to compare candidates and make selection decisions. An overview of what the test measures, the candidate's result and what this indicates, is provided below.

## Verbal Reasoning

This test assesses how quickly and accurately the candidate can process verbal information and use it to draw the correct conclusions. This type of reasoning ability is involved in tasks that require making sense of written information.

Taking into account the number of questions answered correctly, and the time taken for each correct answer, the candidate scored above average on this reasoning test. This suggests they are likely to accurately interpret written information more quickly and effectively than many other people.
